Bulk lets you programatically manage and monitor the threads and easily set parameters to control how many threads will be created. bulk provides thread monitors so that you can easily and efficiently monitor all the threads that are executing in parallel. The thread monitors provide real-time performance data. They monitor and collect all the threads that are currently running and are ready for execution, and the threads that are ready for execution in the ready queue. bulk implements its own task management system that provides the same interface as pthreads and lets you manage multiple parallel jobs. Use bulk to quickly add parallelism to any application. You can easily specify which functions can run in parallel, the number of threads that will be created, and how much time each job can take. bulk provides built-in monitoring features and thread intelligence that make it easy for you to debug problems and monitor the execution progress of your application. By providing built-in monitors, bulk is compatible with multiple software packages and doesn't require you to recompile your code. The built-in monitor provides data on the number of threads that are currently running and are ready for execution, and the threads that are ready for execution in the ready queue. Check out the following to see how you can easily use bulk to speed up your application. ddde 0.0.1 Check out this link for more details: bulk is a command line tool that allows you to schedule functions for execution and provides a C++ Library that provides access to multi-threading.
